

# CORNERSTONE OF MYANMAR'S SELF-FINANCED MINI-GRIDS SUCCESS: PRODUCTIVE END USE OF ELECTRICITY

Dipti Vaghela

Fulbright Public Policy Fellow

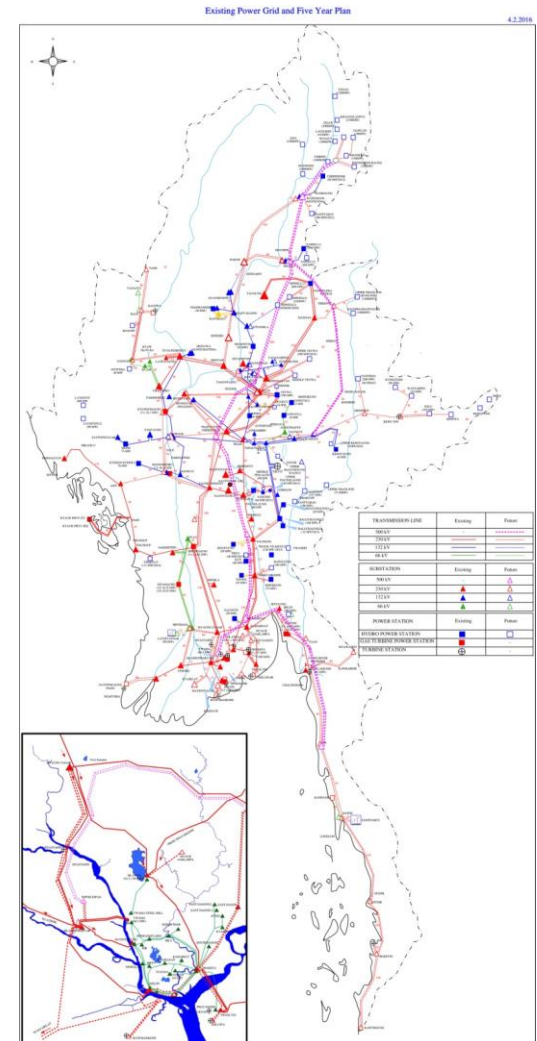

placed at the Renewable Energy Association of Myanmar (REAM)

July 2017, HPNET Webinar: Productive End Use of Mini-Grids using  
Micro/Mini Hydro – Three Examples of How to Make it Happen

# My Fulbright Public Policy Fellowship

## Policy Situation Overview

- National Electrification Plan (NEP)
  - 30% to 100% by 2030
  - \$400M World Bank IDA loan
- Gap to address: Mini-Grid Integration
  - “Least Cost” analysis overlooked RE mini-grids, yet 3500+ RE mini-grids exist.
  - Rural electrification policy
    - ‘Business as Usual’ vs. RE Mini-Grids
      - Solar home lighting systems
      - Clean coal and large hydropower

# Mini-Grids in Myanmar

## ~30-years of Experience

Data Sources: Department of Rural Development 2015; World Bank NEP PAD 2015; Consultant Analysis

Source: Witoon Permpongsacharoen, Mekong Ecology and Energy Net (MEE Net), "Putting Green Energy Vision into reality in Myanmar," Presentation, March 2017.

# Myanmar's Unique Progress (*success*)

## Lessons for Int'l Development Practitioners

- International development programs **aim to design** programs that can **scale** and **self-replicate**.
- How did **Myanmar's 3500+ mini-grids** (biomass gassifiers and micro/mini hydro) happen?
  - No technology training
  - No international funding
  - No scaled government program or policy
  - **Yet, more mini-grids than any funded program!**
- Opportunity for development partners to *learn from Myanmar* how mini-grids can be scaled and sustainable.

# Source of Myanmar's Mini-Grid Success

## Mini-Grid Social Entrepreneurs

- 20 – 30 years of experience
- Self-Financed, Community-Owned
- Productive End Use built-in
- 3500+ mini-grids
- Self-Engineered Technology

# Closer Look at Locally-Financed Projects

## Naung Pein Project, Northern Shan State

- Output capacity: 200kW
- Construction: 2009 – 2012
  - ▣ Done in phases – electricity supplied since 2010
  - ▣ Head and Design Flow: 274m and 142 lps
  - ▣ Turbine: Pelton; Generator: 300kW
  - ▣ Consumers: 550 in 14-villages (out of 2000 households)
- Transmission and Distribution
  - ▣ 45km total of 11kV, 230V, and 400V
  - ▣ 15 transformers
- National grid arrived: 2017

# Ownership and Financing

## Hybrid: Developer + Cooperative

- Total Cost: \$430,000 (as in 2009) or \$2150/kW
- Financing
  - ▣ 29% Equity (24 village-based shareholders, plus developer)
  - ▣ 52% Community contribution through connection charge
  - ▣ 19% Short-term debt, repaid in 10-months
  - ▣ Ownership: 25 shareholders organized as a cooperative, as per 1992 revision of *Cooperatives Law*.
- Monthly income
  - ▣ Before grid arrival: \$5500 - \$7500
  - ▣ After grid arrival: \$1,100 (as in 2017)
- REAM and Hydro Empowerment Network friends
  - ▣ Working diligently → grid-interconnection pilot project

# Connection Fees and Tariff

## Customized to Community's Strengths

- Connection Fees: \$230 - \$385 (as in 2017)

	No. of Villages	Single-Phase	Additional 3-Phase
Lowest Demand	7	230 USD	No connection charge
Medium Demand	4	307 USD	No connection charge
Highest Demand (near to highway)	3	385 USD	No connection charge

- Mini Hydro Tariff: \$0.15 - \$0.31 per kWh (as in 2017)

	Single-Phase		Additional 3-phase
Types of Consumers	< 30 units	> 30 units	Regardless of consumption
Residential	0.23 USD/unit	0.15 USD/unit	0.31 USD/unit
Commercial Use	0.23 USD/unit	0.15 USD/unit	0.31 USD/unit
Temporary	0.62 USD/unit, plus 77 USD advance		

**Main Grid Tariff: \$0.06 <200 kWh; \$0.08 >200 kWh, plus connection fee (as in 2017); Main grid has poor voltage.**

# Management Body (same staff for 7-yrs)

## Naung Pein Mini Hydropower Utility

### Staff Salaries: Total \$825/month (as in 2017)

- ▣ Manager
- ▣ Cashier
- ▣ Powerhouse Operators
- ▣ Intake Operator
- ▣ Linesmen

လုပ်ငန်းစဉ်ဆောင်ရွက်ရေးအဖွဲ့၏ လုပ်ငန်းစဉ်ဆောင်ရွက်ရေး အစီအစဉ် (အစီအစဉ်ဆောင်ရွက်ရေးအဖွဲ့၏ လုပ်ငန်းစဉ်ဆောင်ရွက်ရေး အစီအစဉ်)

ခုနှစ် - ၂၀၁၇ ခုနှစ် ဇူလိုင်လ (၂၀၁၇)ခုနှစ်

ရက်	အမည်	အလုပ်အကိုင်	အလုပ်အကိုင်	အလုပ်အကိုင်	အလုပ်အကိုင်	အလုပ်အကိုင်	အလုပ်အကိုင်	အလုပ်အကိုင်	အလုပ်အကိုင်	အလုပ်အကိုင်
၀၁	ဦးကျော်စွာ	Manager	၅၅၀၀	၅၅၀၀	၅၅၀၀	၅၅၀၀	၅၅၀၀	၅၅၀၀	၅၅၀၀	၅၅၀၀
၀၂	ဦးကျော်စွာ	Cashier	၅၅၀၀	၅၅၀၀	၅၅၀၀	၅၅၀၀	၅၅၀၀	၅၅၀၀	၅၅၀၀	၅၅၀၀
၀၃	ဦးကျော်စွာ	Powerhouse Operators	၅၅၀၀	၅၅၀၀	၅၅၀၀	၅၅၀၀	၅၅၀၀	၅၅၀၀	၅၅၀၀	၅၅၀၀
၀၄	ဦးကျော်စွာ	Intake Operator	၅၅၀၀	၅၅၀၀	၅၅၀၀	၅၅၀၀	၅၅၀၀	၅၅၀၀	၅၅၀၀	၅၅၀၀
၀၅	ဦးကျော်စွာ	Linesmen	၅၅၀၀	၅၅၀၀	၅၅၀၀	၅၅၀၀	၅၅၀၀	၅၅၀၀	၅၅၀၀	၅၅၀၀

### Management Issues

- ▣ Minimal, e.g. late payments
- ▣ Peak Load – no issues
  - Social awareness
  - Volt meters in enterprises

# Cornerstone of Financial Viability

## Productive End Use

**With exception of a few shops, all use Mini-Hydro instead of Main Grid, due to voltage issues.**

Changed from Diesel Powered		After Arrival of Mini Hydro Project	
Corn milling	4 units	Air compressors for micro water utilities	12 units, 1.5kW each
Corn drying	1 unit, 10-hp	Cement Brick Making (mixer and molder)	3-units
		Telecom Station	1 unit, 2kW
		Patrol Pump Stations	2 units, 3hp each
		Restaurants, Shops	~50 enterprises
		Peanut Oil Press	1 unit, 18kW

# Cornerstone of Financial Viability

## Productive End Use

# Financing for Productive End Use Depends on Socio-Economic Factors

- Depends on Family Income and Skills
  - ▣ Distance to main road
  - ▣ Family members working abroad
  - ▣ Agriculture assets
- Cooperatives
  - ▣ Savings group within the community
- Developer's Role
  - ▣ Identifying villages with existing end uses and new potential
  - ▣ Machinery for productive end use can be made locally
  - ▣ Supporting village share-holders to be exposed to new industry
    - e.g. 18kW Oil Mill given on installment basis by Mandalay company

# Arrival of Main Grid

## What Changed?

- Main Grid Reliability
  - ▣ Poor voltage during peak load
- Number of connections
  - ▣ Same number of permanent connections
  - ▣ Temporary connections dropped from 300 to 100
- **Productive End Use loads on the Mini-Hydro**
  - ▣ Nearly no change, with the exception of a few small shops.
- Tariff / Connection Fees of Mini-Hydro
  - ▣ No change
- MHP Utility Income
  - ▣ Dropped from \$5500-\$7500 to \$1100

# Integrating Productive End Use

## Key Conclusions from Naung Pein

- Productive end use is absolutely required for
  - Mini-grid sustainability: **PEUs still use MHP over main grid.**
  - Socio-economic benefits: **All PEU owners are villagers.**
- Challenge: PEU in economic poor, more rural communities
  - No access to entrepreneurial skillsets
  - No access to financing
  - NEP mini-grids program mandates PEU for NEP mini-grid subsidy. **Yet, no financial support provided for PEU.**
- How can Donors support PEU?
  - Encourage inter-ministerial and multi-stakeholder cooperation
    - JICA 2-step loan for SMEs → How to access for PEU of mini-grids?
  - Soft loans to developers and communities for PEU

# Acknowledgements

This project will soon be featured in a case study by REAM and Winrock International. Please contact [hydroempowerment@gmail.com](mailto:hydroempowerment@gmail.com) for details.
